Electrodiagnosis of Retinal Disease Yozo Miyake

Soon it will be time for me to retire from my position as professor of ophthalmology in the Department of Ophthalmology, Nagoya University School of Medicine. I have therefore decided to summarize my experience of more than 30 years of studies on the clinical electrophysiology of vision. These studies were performed in our department through the hard work and good ideas of many co-workers, and the chapters of this book cover the rationale and results of our studies. Because excellent textbooks on clinical electroretinography already exist, my wish is not to write another textbook; instead, this book is in the form of essays that include my beliefs and philosophy on the clinical electrophysiology of vision. As such, this book does not include every clinical disease but only those that we have identified or studied in detail. In addition to full-field electroretinography (ERG), we developed the techniques and instrumentation to record focal macular ERG more than two decades ago. Using these techniques, we were able to determine several new physiological properties of the normal macula, many new pathophysiological mechanisms of known diseases, and some new clinical entities with unique functional properties. Fortunately, the recent advances of macular surgery and imaging are such that the macular configuration can easily be determined. During the process of surgery, we have obtained considerable information on the correlation of macular function and macular morphology using focal macular ERGs and optical coherence tomography (OCT).
